2.1 Laws of Indices & Surds

Contents

- * 2.1.1 Laws of Indices
- * 2.1.2 Manipulating Surds
- * 2.1.3 Surds Rationalising the Denominator

2.1.1 Laws of Indices

Your notes

Laws of Indices

What do I need to know about laws of indices?

- Laws of indices (or index laws 'index' is the singular, 'indices' is the plural) allow you to simplify and manipulate expressions involving powers
- The index laws you need to know and use are summarised here:

$$o \quad a^m \times a^n = a^{m+n}$$

$$oldsymbol{a} \circ d^m \div d^n = d^{m-n}$$

$$\circ \ \ \mathsf{d}^{\frac{m}{n}} = \sqrt[n]{\mathsf{d}^m}$$

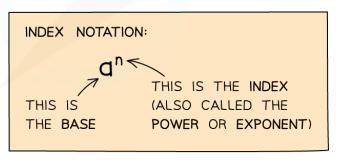

$$\circ$$
 $(a^m)^n = a^{mn}$

•
$$q^{-m} = \frac{1}{q^m}$$

$$\circ$$
 $(ab)^n = a^n b^n$

$$\circ$$
 $a^1 = a$

Changing the base of a term

- Sometimes expressions involve different base values
- You can use index laws to change the base of a term to simplify an expression involving terms with different bases
 - For example $9^4 = (3^2)^4 = 3^{2 \times 4} = 3^8$
 - Using the above can then help with problems like $9^4 \div 3^7 = 3^8 \div 3^7 = 3^{8-7} = 3^1 = 3^{10}$

Examiner Tip

■ Index laws only work with terms that have the same base, so something like 2³ x 5² cannot be simplified using index laws

Worked example	

Given that $y = \frac{1}{27}x^3$ express each of the following

in the form kx^n , where k and n are constants.

a)
$$y^{\frac{1}{3}}$$

b)
$$\frac{1}{9}y^{-2}$$

a)
$$y^{\frac{1}{3}} = (\frac{1}{27}x^3)^{\frac{1}{3}}$$

 $= (\frac{1}{27})^{\frac{1}{3}}(x^3)^{\frac{1}{3}}$
 $= \sqrt[3]{\frac{1}{27}}x^{3x\frac{1}{3}}$
 $= \frac{1}{3}x^1 = \frac{1}{3}x$

b)
$$\frac{1}{9}y^{-2} = \frac{1}{9} \left(\frac{1}{27}x^3\right)^{-2}$$

 $= \frac{1}{9} \left(\frac{1}{27}\right)^{-2} (x^3)^{-2}$
 $= \frac{1}{9} \left(\frac{1}{\frac{1}{27}}\right)^2 x^{-6}$
 $= \frac{1}{9} (27)^2 x^{-6}$
 $= 81 x^{-6}$
 $= \frac{81}{9}$

2.1.2 Manipulating Surds

Your notes

Manipulating Surds

What are surds?

• If n is a positive integer and is not a square number, then \sqrt{n} (or any multiple of \sqrt{n}) is a surd

• Surds are examples of irrational numbers

What do I need to know about manipulating surds?

• There are two basic rules you need to know in order to manipulate and simplify surds:

$$\sqrt{ab} = \sqrt{a} \times \sqrt{b}$$

$$\sqrt{ab} = \sqrt{a} \times \sqrt{b}$$

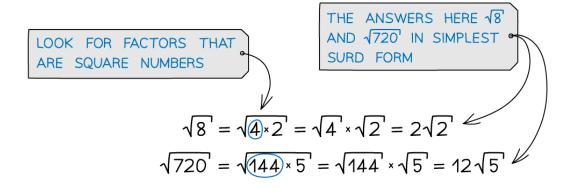

$$\sqrt{ab} = \sqrt{a} \times \sqrt{b}$$

$$\sqrt{ab} = \sqrt{a} \times \sqrt{ab}$$
ALSO DON'T FORGET HOW THIS WORKS WITH RECIPROCALS:
$$\frac{1}{\sqrt{ab}} = \frac{1}{\sqrt{a}} = \sqrt{b} = \sqrt{a}$$

~

When simplifying, look for square factors

• You can collect like terms with surds like you do with letters in algebra:

Your notes

$$7\sqrt{3} - 5\sqrt{3} = 2\sqrt{3}$$

$$5\sqrt{2} - 2\sqrt{5} - 8\sqrt{2} + 3\sqrt{5} = -3\sqrt{2} + \sqrt{5}$$

Copyright © Save My Exams. All Rights Reserved

 But be careful not to confuse this with the multiplication and division rules... cannot add or subtract 'under the surd':

$$\sqrt{a} + \sqrt{b}$$
 IS NOT EQUAL TO $\sqrt{a+b}$

opyright © Save My Exams. All Rights Reserved

Where can surds be useful?

- Using surds lets you leave answers in exact form
 - e.g. $5\sqrt{2}$ rather than 7.071067812
- Understanding how to simplify surds can help reduce expressions and collect like terms

THIS MEANS WE CAN DO THINGS LIKE

$$\sqrt{32} + \sqrt{8} = \sqrt{16} \times \sqrt{2} + \sqrt{4} \times \sqrt{2}$$
$$= 4\sqrt{2} + 2\sqrt{2}$$
$$= 6\sqrt{2}$$

Examiner Tip

- Leaving answers in surd form can be really helpful when you need to carry an exact value through to another part of working
- When simplifying surds, remembering your square numbers is really helpful!

Worked example

Simplify $\sqrt{125} - \sqrt{45}$ giving your answer in the form $a\sqrt{5}$, where a is an integer.

THE FORM OF THE REQUIRED
ANSWER LETS YOU KNOW
THAT 5 SHOULD BE ONE OF
THE FACTORS IN BOTH
SURDS HERE!

$$\sqrt{125} - \sqrt{45} = \sqrt{25 \times 5} - \sqrt{9 \times 5}$$

$$= \sqrt{25} \times \sqrt{5} - \sqrt{9} \times \sqrt{5}$$

$$= 5\sqrt{5} - 3\sqrt{5}$$

$$= 2\sqrt{5}$$

2.1.3 Surds - Rationalising the Denominator

Your notes

Surds - Rationalising the Denominator

What does it mean to rationalise a denominator?

 Rationalising a denominator changes a fraction with surds in its denominator, into an equivalent fraction where the denominator is a rational number (usually an integer) and any surds are in the numerator

• There are three cases you need to know how to deal with when rationalising denominators:

IF THE FRACTION IS IN THE FORM TO

- MULTIPLY THE NUMERATOR AND DENOMINATOR BY \sqrt{a}
- IF THE FRACTION IS IN THE FORM $\frac{1}{\sqrt{a}+\sqrt{b}}$, MULTIPLY THE NUMERATOR AND DENOMINATOR BY $\sqrt{a} - \sqrt{b}$
- IF THE FRACTION IS IN THE FORM $\frac{1}{\sqrt{a}-\sqrt{h}}$, MULTIPLY THE NUMERATOR AND DENOMINATOR BY \alpha + \b

IN THE LAST TWO CASES, EITHER TO OR TO CAN REPLACED BY AN INTEGER. SIMPLY MODIFY YOUR MULTIPLIER TO MATCH.

FOR EXAMPLE, IF YOUR FRACTION IS IN THE FORM $\frac{1}{a+\sqrt{h}}$ THEN MULTIPLY THE NUMERATOR AND DENOMINATOR BY $a - \sqrt{b}$.

Save my exams

Examiner Tip

- If an exam question asks you to give an answer, for example, "in the form $p + q\sqrt{3}$, where p and q are rational numbers", this does NOT mean that p and q have to be integers, or positive!
- Remember: both integers and fractions (both positive and negative) are rational numbers

Worked example

Simplify
$$\frac{4-3\sqrt{3}}{5-\sqrt{3}}$$
 giving your answer in the form $p+q\sqrt{3}$,

where p and q are rational numbers.

USE FOIL TO
MULTIPLY THESE
TERMS OUT

$$\frac{4 - 3\sqrt{3}}{5 - \sqrt{3}} \times \frac{5 + \sqrt{3}}{5 + \sqrt{3}} = \frac{20 + 4\sqrt{3} - 15\sqrt{3} - 9}{25 - 3}$$

$$= \frac{11 - 11\sqrt{3}}{22}$$

$$= \frac{1}{2} - \frac{11\sqrt{3}}{22}$$
